

HC HANDBOOK

#evidencebased

Identify and appropriately structure the information needed to support an argument effectively.

Please fill out this [Google Form](#) to submit suggestions for this page (i.e. typos, study guide contributions, useful applications, etc.). We are actively seeking feedback on anything big or small to make the HC Handbook as useful as possible.

Defining the HC

Pitch

An argument without evidence is merely an opinion.

Paragraph Description

A written or spoken communication intended to make a specific point should clearly present relevant and persuasive evidence. Doing this well is a two-step process. First, one must identify the evidence relevant to supporting the conclusion. The argument must be formulated to be consistent with the supporting evidence and should address apparent contradictions. Second, one must arrange evidence effectively. This means anticipating where one’s audience will notice a need for evidence, determining how much evidence will be needed given the strength of the conclusion, and deciding on how best to present the evidence (e.g., as a set of claims, a figure, a quote, or a paraphrase). In all cases, evidence should support underlying assumptions and show that the implications of the argument are consistent with established facts and principles.

Habit of Mind | Thinking Critically to Evaluate Justifications |
Thinking Critically | Evaluating Justifications

Cornerstone Introduction

Class: Empirical Analysis | Semester One

Unit: Problem Solving

Big Question: How can we feed the world? How should we allocate water?

General Example

You have a proposal for how to help your elementary school students learn math, and need to convince your academic supervisor that it is worth implementing. While preparing your presentation, you organize evidence to support two main lines of reasoning: interventional studies that showed the efficiency of the method and results of similar programs in other cities that were able to learn more complex materials with a curriculum involving this method. You select the best original figures and results, interpret them and add overarching conclusions from the individual examples and the evidence as a whole. You evaluate the studies you present, explaining the strengths and weaknesses of the evidence you use and explaining why it is generalizable to your school. Finally, you mention potential counter-arguments to the method such as the associated capital and labor costs, but explain why the advantages that the implementation offers outweigh the disadvantages.

Footnote: *Two main lines of evidence were employed to support the argument for the math curriculum modification. Raw findings and overall conclusions were presented and interpreted to support the merits of the program, and the use of evidence was justified through an evaluation of its strengths and explanation of their significance. Counter-arguments were considered and refuted.*

Is it this HC?

Is #evidencebased the right HC? If the answer to the following questions is yes, #evidencebased could be useful:

- 1. Is the work explaining why a source is relevant to an argument?
- 2. Is the work justifying the quantity, placement, and type of evidence given factors like the work’s audience, medium, length, and purpose?
- 3. Is the work quoting, paraphrasing, summarizing, or a different form of restating another’s work being utilized?
- 4. Is the work critiquing how an argument presents evidence to support its claim?

However, depending on the focus of your work, there might be other applicable HCs to consider. Consult the following table listing possible related HCs.

The following HC might apply if the work:	
#sourcequality	explains why a source is credible.
#dataviz	supports its arguments using visual components like pictures or diagrams, including specific references, aggregate views, and trends. See the HCs for Visuals guide for more.

#descriptivestats	• outlines and accurately calculates specific quantities meant to summarize data like mean, standard deviation, and range. • analyzes the implication of specific quantities.
#induction	• evaluates the strength and reliability of an argument given its evidence. • uses multiple pieces of evidence to construct an inductive argument.
#organization	• builds the structure and flow of an argument by determining the best placement of sub-arguments and evidence.
#medium, #audience, #context	• uses these HCs along with #evidencebased to identify where, what type, and how much evidence to present.
#plausibility	• evaluates the previous findings and assumptions underlying a hypothesis.

Self Study

Try answering the questions on your own before checking the example answers.

 **What counts as evidence?**

 **Is personal experience evidence?**

 **How much evidence is too much?**

 **Are direct quotes always required when offering interpretations of arguments or articles?**

 **Should researchers seek only evidence that supports their ideas?**

Applying the HC

Guided Reflection

- Have you included evidence of the appropriate type (quantitative vs. qualitative, empirical vs. normative) or a combination of them in the given context?
- Have you identified information that makes for compelling (relevant and substantial) evidence?
- Have you backed every claim with evidence and explained how your evidence supports the claim?
- Have you gone through your text and understood which pieces need evidence?
- Have you clearly identified the argument you are backing up with evidence?
- Have you sought out and considered any counter-evidence for your claims?
- Have you used enough sources in consultation with assignment guidelines and discipline-specific norms?
- Have you included in-text citations for every source listed in your references?
- Have you effectively evaluated the presentation of evidence for a given purpose by others and justified the evaluation (when applicable)?
- Have you included an annotation (footnote/endnote) highlighting how and why you've utilized evidence, demonstrating that you've considered alternative approaches?

Common Pitfalls

- The application copy-pastes evidence from a source without additional analysis.
- The application does not cite enough high-quality sources, given the author's goal.
- The application has evidence and a work cited page but no in-line citations, so it is difficult to know where the information comes from.
- The application backs claims with evidence, but the line of reasoning is difficult to follow.
- The application mismatches the kind of evidence and the claim it is designed to support, as in the case of using empirical evidence to support an ethical claim or vice versa.
- The application trivializes a claim rather than substantiating the claim with evidence. Rather than write, "The majority of people in Brazil like their president," and cite evidence like political polls or journals, the application states, "Some people in Brazil like their president."
- The application has data and trend charts but does not reference or analyze them.
- The application relies on statements of personal opinions rather than making claims and backing them up with evidence.

Applying the HC at Minerva

You will use evidence any time you present an idea or argument, which will be often at Minerva. No claim can stand alone: context-specific evidence is necessary to provide strength and credibility. Therefore, evidence will be expected when building any argument, regardless of whether it is a thesis-driven essay, research paper, video, survey, or case study. Since evidence is so widely applicable, it will take many forms and come from various sources. However, proper attribution to the original author is obligatory.

Some examples of #evidencebased applications are shown below:

- You research what causes tendonitis and existing treatments. This evidence fuels your hypothesis that a new medicine that claims to reduce inflammation and increase growth factors around the swollen area will reduce the effect of tendonitis in people. You administer an interventional study on the effect of a new medicine on people with tendonitis. There is a control group with tendonitis and no drug to compare to. You take MRIs of both groups before and after a month-long period. You do a p-test on your findings to determine whether or not this medicine had a statistically significant benefit, meaning it lowered inflammation. Your evidence could include the following:
 - A description of your process.
 - The visual evidence from the MRIs.
 - The p-test results.

You would then need to thoroughly explain what this evidence means and whether or not it supports the use of the medicine.

- You are writing a paper that advances an ethical argument in favor of increased gun control measures in America. While you use empirical evidence to support your claim about the effects of gun violence, you primarily need to develop ethical theoretical evidence to support your claim that gun purchases should be limited. You decide to introduce Utilitarian ethical theory as the basis for your argument. Your evidence could include the following:
 - Analysis and application of the core Utilitarian ethical principle, the greatest happiness principle, to this case.
 - A counter-argument that poses an objection to this ethical principle, perhaps from a libertarian perspective in favor of a fundamental right to private property.
 - A response to that counter-argument on behalf of the Utilitarian ethical theory, and defense of the adequacy of this theory in support of your argument about gun control.

You draw from textual evidence to support your interpretation and application of that theory to this example and support the credibility of this evidence by posing and responding to a counter-argument.

- You are trying to persuade your Minerva peers that skateboarding is the best way to navigate San Francisco.

Tailoring both your evidence and your presentation of this evidence to your peers informs your application in this case. For example, you may realize your audience is passionate about sustainability and has a short attention span. In that case, your evidence could include the following:

- The use of a data visualization to show how much carbon other forms of transport emit compared to skateboarding, based on empirical evidence you find and cite.
- You also use a personal anecdote of your great skateboarding experience. This is appropriate because you are acquainted with your audience, and you're confident that they'll find your experience engaging and credible.

Applying the HC Outside of Minerva

- This HC is always applicable in how we structure and present our point of view or any argument, whether tailored for our friends, co-workers, or boss. It is also relevant in many contexts, whether for an article, research paper, speech, or any other form of communication. Identifying and structuring relevant evidence effectively is essential to thinking and communicating critically.
